1 Introduction

One of the major goals of the Survey of Consumer Payment Choice (SCPC) is to provide publicly available, consumer-level longitudinal data to support research on consumer payments and to provide aggregate data on trends in U.S. consumer payments. This survey is the companion to the Diary of Consumer Payment Choice (DCPC).

The questionnaires and public datasets for the 2020 SCPC are available for download on the Atlanta Fed website. The data are provided in Stata, SAS, CSV, and Rdata formats. The Atlanta Fed assumes that data users are familiar with a statistical analysis software package such as Stata, SAS, or R. The Atlanta Fed does not provide any software assistance.

This document is a data user’s guide for the SCPC survey data. Anyone interested in conducting research based on SCPC data will find it helpful to become familiar with this document. See the 2020 Survey of Consumer Payment Choice: Technical Appendix for details on questionnaire changes, data collection, sampling methodology, and hypothesis test results.

A broad overview of the 2020 SCPC, including a summary of the survey and tables of survey results, can be found in the The 2020 Survey of Consumer Payment Choice results paper on the Atlanta Fed website.

2 SCPC variable overview

There are three broad categories of SCPC variables. Below we provide general information about each.

UAS My Household Questionnaire variables represent a small fraction of variables that come from the UAS My Household survey (MH). The MH survey is used to gather demographic data about each respondent. UAS members take the MH survey quarterly, and their most recent responses to the MH survey are included in these SCPC datasets. Visit the UAS website for more information about the UAS MH survey.

Survey variables are the actual results from the SCPC survey questions. Survey variables have variable names such as pa001_a or pu004_b. To see the exact question text, respondent instructions, response option wording, and structure of the questions on the screen, it is recommended that data users refer to the survey questionnaire. The questionnaire is available on the Atlanta Fed website. Two important considerations of the survey variables are:

---

*email: kevin.foster@atl.frb.org

2 Click here to see the standard variables included in the UAS MH questionnaire.
Randomization of response option orders: To avoid potential biases arising from the order of response options presented to respondents, the survey instrument randomizes response options for some questions. The questionnaire clearly indicates if response options were randomized. The unrandomized variables have the same variable names as the original survey variables. The raw data from the unrandomized variables and the SAS macros that unrandomize the responses will be made available upon request.

Responses for different time frequencies: Respondents are given the option of reporting payment use in terms of a typical week, month, or year. This dataset includes variables where responses have been standardized to a monthly frequency. These created, “frequency converted” variables have the same name as the original responses, but without a numeric suffix. For instance, the variable pu006a_a refers to the number of cash payments for retail goods in a typical month, after frequency conversion. The set of three original variables that produce pu006a_a are pu006a_a1 (respondent used the weekly box to report these transactions), pu006a_a2 (monthly) and pu006a_a3 (yearly). All the variables in the Payment Use section (pu002, pu003, pu004, pu005, pu006a, pu006c, pu021 families of variables) have corresponding created variables which are described in Section 2.2.4, Payment use. The SAS macros for the frequency conversions can be made available upon request. The Atlanta Fed recommends that data analysts use the created frequency converted variables in their analysis and research.

Created variables are created by Atlanta Fed staff to populate the SCPC results tables and to aid in data analysis. Most of these variables have descriptive names based on a combination of mnemonics. For example, the variable cc_typ consists of two mnemonics: cc stands for “credit card”, and typ stands for “number of transactions in a typical month”. More insight into variable name mnemonics is provided in Section 2.2.

2.1 Survey variables

2.1.1 Respondent identifier

The variable id is a six digit numeric variable. Data users can use the id variable to merge this dataset with other Atlanta Fed SCPC or DCPC datasets downloaded from the Atlanta Fed website. This variable replaces the UAS identifier variable uasid. To merge this survey’s data with other UAS datasets, please visit the UAS data website to download the original dataset UAS301. Registration may be required on the UAS data download website.

2.1.2 Survey weight

The weight variable in this survey dataset is r_weight. For information about how the survey weights are calculated, please see the 2018 SCPC Technical Appendix and 2018 Survey and Diary of Consumer Payment Choice—Sampling and Weighting by Marco Angrisani. The Atlanta Fed survey staff recommends that data analysts use the survey weight when generating population estimates.

2.2 Created variables

Most created variable names are a combination of two or more mnemonics, combined using underscores. Typically, the first mnemonic refers to payment instrument, type of account, or a method of payment. The second or last mnemonic often indicates the concept being communicated, such as adoption (_adopt), or typical use (_typ). This section describes the most common mnemonics.

2.2.1 Payment instruments

Payment instruments are grouped as follows:

### 2.2.2 Transaction types

The payment use section of the survey asks respondents to tell us the number of payments they make in a typical time period (week, month, or year). Those numbers then get converted to monthly numbers. Each screen of the payment use section corresponds to a transaction type. The transaction types are listed in this table.

<table>
<thead>
<tr>
<th>abp</th>
<th>Automatic bill payment</th>
</tr>
</thead>
<tbody>
<tr>
<td>obp</td>
<td>Online bill payment</td>
</tr>
<tr>
<td>ipbp</td>
<td>In-person bill payment (or via mail)</td>
</tr>
<tr>
<td>op</td>
<td>Online (non-bill) payments</td>
</tr>
<tr>
<td>rp</td>
<td>Retail payments (made in-person)</td>
</tr>
<tr>
<td>serv</td>
<td>Services and other payments (in-person)</td>
</tr>
<tr>
<td>p2p</td>
<td>Person-to-person payment</td>
</tr>
</tbody>
</table>

Transaction types are grouped as follows:

<table>
<thead>
<tr>
<th>bp</th>
<th>Bill payment i.e. sum of abp, obp, ipbp</th>
</tr>
</thead>
<tbody>
<tr>
<td>nonbp</td>
<td>Non-bill payments, sum of op, rp, serv, and p2p</td>
</tr>
</tbody>
</table>

### 2.2.3 Payment adoption

The suffix `_adopt` is used in variables that indicate adoption of accounts or payment instruments. It is recommended that the data user use these variables, as the related concepts in the survey do not match one-to-one with these variables. For instance, the variable `cash_adopt` is created from several survey variables. SAS code for creating these variables is available upon request.

### 2.2.4 Payment use

For each payment instrument and seven transaction types, respondents are asked to report their payment use behavior—how frequently they use a payment instrument for a specific transaction type. Therefore, at the most disaggregated level, a payment use variable name consists of three mnemonic components: the payment instrument (Section 2.2.1), followed by the transaction type (Section 2.2.2), and ending with the
suffix _typ which indicates the variable represents the number of payments of that transaction type and payment instrument made in a typical month. The variable tot_pay_typ is defined for each respondent as the sum of all payments made in a typical month.

It is important to note that not all combinations of payment instruments and transaction types exist. This is because they were assumed not to be possible at the time of the survey. The following table illustrates combinations that do exist in the data and the corresponding combinations of mnemonic prefixes:

<table>
<thead>
<tr>
<th>bp</th>
<th>nonbp</th>
</tr>
</thead>
<tbody>
<tr>
<td>abp</td>
<td>csh</td>
</tr>
<tr>
<td>obp</td>
<td></td>
</tr>
<tr>
<td>ipbp</td>
<td></td>
</tr>
<tr>
<td>op</td>
<td></td>
</tr>
<tr>
<td>rp</td>
<td>csh</td>
</tr>
<tr>
<td>serv</td>
<td></td>
</tr>
<tr>
<td>p2p</td>
<td></td>
</tr>
<tr>
<td>tc</td>
<td></td>
</tr>
<tr>
<td>dc</td>
<td>csh</td>
</tr>
<tr>
<td>cc</td>
<td></td>
</tr>
<tr>
<td>svc</td>
<td></td>
</tr>
<tr>
<td>obbp</td>
<td></td>
</tr>
<tr>
<td>banp</td>
<td></td>
</tr>
<tr>
<td>income</td>
<td></td>
</tr>
</tbody>
</table>

### 2.2.5 Flags for variables that were cleaned for outliers

The SCPC has many continuous variables. These variables come from survey questions where the respondent is allowed to enter a number into a box. For instance, we ask the respondent to tell us how many credit card payments they make for retail goods in a typical week, month, or year. Continuous variables in the SCPC are cleaned for outliers and edited based on algorithms described in the 2018 SCPC Technical Appendix. To indicate an edited variable, the prefix “f_” is added to the front of a variable name. A flag value of 0 indicates that the particular observation was not edited. A flag value greater than 0 means the observation was edited. If a value was edited, a variable of the same name but with the suffix _unedited contains the original value.

### 3 A note on histograms in this codebook

Many of the distributions for the continuous variables have long right tails. In order to display the histograms in a way that allows the reader to see the detail close to zero, the data was trimmed at the 95th percentile. The right-most bar displayed contains the cumulative frequency of observations from the 95th percentile (inclusive) to the maximum value.

In certain cases, the histogram may show a negative value. This occurs rarely, when the 95th percentile is equal to zero.
