Guide to the 2015 Diary of Consumer Payment Choice

Federal Reserve Bank of Boston: Consumer Payments Research Center

May 24, 2018

Introduction

The Diary of Consumer Payment Choice (DCPC) is a survey of consumer payment habits run in conjunction with the University of Southern California's Understanding America Study (UAS). Respondents were randomly assigned a three-day period between October 13th, 2015 and December 17th, 2015 and asked to track all of their payments using an online questionnaire. Respondents were also asked to report some account balances and income payments on the night before the beginning of their diary period. Some respondents were offered the opportunity to do the survey twice - once in October-November, and again in November-December - and many accepted. Respondents were also provided paper memory aids to help keep track of their payments. To the extent possible, attempts were made to ensure that on any given day a representative sample of US residents was actively taking the diary, and any given day can be made statistically representative by using appropriate sample weights. In addition to in-person purchases, respondents were also asked to record their cash holdings, cash deposits, checking transfers, and other exchanges of liquid assets. Respondents were further asked to report income payments. The result is a dataset containing 11,503 unique transactions by 1,392 individuals over 1,901 diaries, including 8,959 expenditures, 1,323 account transfers, and 1,221 income payments. All in all, the DCPC allows a researcher an unusually clear window into the household finances of the American consumer.

Structure of the survey instrument

The DCPC asked respondents to track all purchases, bills, and movements of cash over a three-day assigned diary period, which were entered into an online survey every evening. Diarists were also asked to report income payments and some account balances the night before the first diary day (diary day 0). The diary day can be identified using the variable *diary_day*. Attempts were made to ensure that the sample of respondents was not just representative through the whole of the October 16 to December 15 period, but also representative on any given date. Diarists were provided with optional memory aids to help keep track of the relevant details, and some real-time error checking was automatically performed by the survey instrument.

Written and compiled by Jason Premo.
jason.premo@bos.frb.org

Modules and duplicates

The instrument is organized in several modules which deal with certain kinds of transactions – for instance, Purchases, Cash Withdrawals, and Checking Transfers. During these modules, respondents are typically asked to list the number of purchases/cash withdrawals/checking transfers/etc they had on a given day, after which they are asked follow-up questions about each individual transaction. The variable module can be used to identify which module an observation was originally pulled from. Note that while the modules can have rather suggestive names, one should not rely on the name of the module to identify the type of transaction an observation represents – not all transactions reported in the Purchases module are necessarily "purchases", as some transactions may be recategorized after-the-fact if the respondent makes a mistake. Respondents were asked many followups which are much more reliable means of identifying a transaction's purpose. See Structure and use of the data below for more information. In some cases a respondent would report the same transaction in multiple modules. For instance, a respondent might report a utility bill payment in both the Purchases and Bills module. These duplicates are culled from the dataset, and the *module* variable is modified to reflect that a transaction came from multiple parts of the survey. Transactions are considered to be duplicates if they have a matching prim_key (primary respondent identifier), date, amnt (transaction amount), and pi (payment instrument) in cases where pi is available, and prim_key, date, and amnt in cases where pi is not available.

Some notes on the sampling methodology and skip patterns

In order to reduce unwanted heterogeniety in response quality across days due to diary fatigue, some diarists were assigned diary peiriods beginning on October 13th, October 14th, and October 15th, and some diarists were assigned diary periods ending on December 16th and December 17th. This was to ensure that every individual day in the October 16 to December 15 range has an approximately equal mix of diarists completing their 0th, 1st, 2nd, and 3rd diary days. For any statistical analysis which attempts to be representative, the "burn-in" days of October 13-15 and the "burnout" days of December 16-17 should be dropped. These observations are automatically excluded if the provided daily weights are used, but must be excluded manually when using the individual weights – see the weighting section below. For more information on the sampling methodology, see the 2015 DCPC Technical Appendix or 2015 Survey and Diary of Consumer Payment Choice Weighting Proceduring (2016) by Marco Angrisani. In order to conserve valuable survey time and prevent the diary from becoming onerous, the diary employs skip patterns to determine whether or not a respondent is asked a given question. In most cases, this is intuitive; a respondent who does not report a credit card payment is not asked about the logo on their credit card. In other cases, however, it can be potentially misleading. For instance, respondents are only asked if they had cash stolen if their reported end of day cash balance fails to match their reported cash transactions (within a margin of error). Thus, in some cases it may be necessary for the researcher to trace variables back to their original diary questions in order to obtain a full understanding of the universe of respondents for a given question.

Structure and use of the data

The DCPC data contains 19,109 unique observations, the majority of which represent a single transaction by a single respondent on a single day. Any observation can be uniquely identified by the person, the diary (for multiple diarists), the day, and a constructed variable which orders the transactions within a given day. In the data, these variables are *prim_key*, *diary*, *date*, and *tran*. The variable *diary_day* can be used in place of *date*, if so desired, and is necessary for identifying diary day 0.

The type variable

Any given transaction will have non-missing values for the variable *type*, which identifies what sort of transaction the observation represents. Observations can either represent an expenditure, a transfer, or an income receipt, or serve as a placeholder. Understanding the *type* variable, and its associated *from_account* and *to_account* is integral to properly using the data, so a short guide is included here.

Expenditures

Expenditures are defined to be money moving out of a respondents possession – for instance, purchasing an item at a store. Expenditures generally come from the Purchases or Bills modules, though they may come from other modules as well. A substantial number of merchant categorization followups were asked for each transaction reported in the Purchases and Bills modules to determine what the expenditure was for; all of these followups have been merged into the variables *merch*, *submerch*, *purpose*, and *subpurpose*. Using these variables one can, for instance, identify consumption.

Transfers

Transfers are when money is moved from one account/form to another. In order to identify the actual movement of money, one should make use of the *from_account* and *to_account* variables. Transfers may come from almost any module. For instance, a cash withdrawal would be a transfer from a checking account to cash and would come from the Cash Withdrawals module, while a credit card bill payment could be a transfer from a checking account to a credit account and might come from the Purchases module.

Income

Income is defined as money coming into the respondents possession. Most income is reported in the Income module, though some types of Cash Withdrawal transactions are also considered income – for instance, receiving money from a family member. Note that, unlike other types of transactions, income receipts can be reported on diary day 0.

Placeholders

Every respondent-diary-day has a placeholder observation that contains only the day-level and transaction-level variables; these are inserted into the dataset to ensure that one can filter out observations along any other variable without removing respondents from the dataset. For instance, one can filter out all Transfers and Income receipts (type = 1 and type = 2) without worrying about losing those respondents who had no expenditures.

Dollar amounts

All transactions which represent a movement of money will have a dollar amount associated with them. This dollar amount is stored in the variable *amnt*. Some subjective outlier cleaning has been applied to these dollar amounts, and the original dollar amounts, as originally reported by the respondents, are stored in *amnt_orig*. Dollar amounts were cleaned based on their subjective likelihood given the type of transaction, the respondent's answer to the various merchant followups, the respondent's written answers in some of the "other" boxes in the survey (which are not included in this dataset), and the respondent's answers to some of the questions in the Survey of Consumer Payment Choice (SCPC). In most cases, unrealistically large dollar amounts are the result of an omitted decimal point.¹

Other key variables

Each transaction also includes, when applicable, an amount (variable amnt), a time (variable time), a payment instrument (variable pi) – e.g., cash, credit, check – a merchant category – e.g., financial services, restaurants, transportation – and the device with which the payment was made – e.g., a mobile phone – as well as several other variables related to the payment. With the data so organized, it is a very simple matter to estimate, say, the average value of a cash transaction at a restaurant, or the average number of credit payments in a given month. It may also be possible, under some reasonable assumptions, to generate running balances of the various liquidity accounts in a respondent's possession.

Structure of this document

This code book is arranged both alphabetically and by level of response; variables that apply to a given transaction are listed first, followed by variables that apply to a given diary day, followed by variables that apply to a given diary. Though variables are generally listed alphabetically, within each subcategory the unique identifier for that subcategory is listed first – thus, *prim_key* (mentioned above) is the first variable listed among the individual level variables. A table of contents is provided on the next page.

¹The data contain one very large transaction of \$85,000 which can substantially alter some mean estimates. This transaction is confirmed to be correct based on the respondent's written responses to some of the followup questions.

For each variable, a description is provided which states what it is meant to represent, as well as the coding of the original survey question which can be used to look the question up in the survey questionnaire. When necessary, additional details are provided about how the variable was altered or constructed from the original survey response. Additional histograms and unweighted transaction-level summary statistics are provided for continuous-valued variables, while simple tabulations and codings are provided for categorical variables.

Survey vendors

The University of California's UAS panel was used for the majority of surveys. However, in order to increase the number of observations, some respondents were gathered from GfK and Qualtrics. The source of a respondent can be identified by using the variable *vendor*. The ultimate count for each survey vendor was

• UAS: 1,155

• GfK: 357

• Qualtrics: 85

Note that the Qualtrics respondents are not included in the public use dataset, nor are those who did not complete the diary. A tabulation of the respondents that are ultimately included in the dataset can be found on the page for *vendor* below.

Weighting

To allow for estimations that are representative of the United States, two sets of sample weights are provided in the base dataset, as well as many others in the *full_weights* dataset. The first set of base weights, *ind_weight*, are individual-level post-stratification weights; these correspond exactly to *rps_w_uasgfk* in the *full_weights* dataset. The second set of weights, *day_weight*, are day-level weights, and correspond exactly to *rps_w_day_a_uasgfk* in the *full_weights* dataset. All weights are relative weights – they have a mean of 1 and sum to the number of observations in the dataset. The daily weights provided in the base dataset should *not* be used for estimates that include diary day 0 observations. Weights appropriate for the inclusion of diary day 0 are included in the *full_weights* dataset.

For more information about how the weights are constructed and the various type of weights available in *full_weights*, see 2015 Survey and Diary of Consumer Payment Choice Weighting Proceduring (2016) by Marco Angrisani.

Survey Question

pay002

bill	No.	%
0	7,305	76
1	2,327	24
Total	9,632	100

Details

Question pay002 is used to identify bills reported in the purchases module. All bills reported in the bills reminder module are bills by definition. Observations for which "other" was chosen are manually recategorized. Note that, due to the wording of the question, a very large proportion of respondents (about 25-30 percent) chose "other" and described their pay-

ment in words. We attempted to come up with rules for recategorizing these responses, but there were too many to do each one individually.

Coding

- 0 No
- 1 Yes

bill_imp

Description

Whether observation was identified as a bill during the data cleaning process, as opposed to reported as such by the respondent. Researchers may prefer to use the respondent's original answer.

Survey Question

Some transactions were identified as bills expost, during the cleaning process, on the basis of what the respondent typed in some of the "other" boxes. These hand-typed responses are not available in the public dataset for privacy reasons.

Annualized according to response values. Back to top

from_account

Description

The account from which the funds for this transaction were sourced.

Survey Question

N/A

Details

from_account and to_account are purely constructed variables which tracks the movement of money between accounts, as well as tracking which accounts expenditures came from and which accounts income went to. They should generally be used in conjunction with type to truly understand the movement of money.

Coding

- 1 Currency
- 2 Primary checking
- 3 Other DDA account
- 4 Nonfiancial deposit account (e.g. paypal, prepaid card)
- 5 Investment account
- 6 Credit account
- 7 Other long-term assets
- 8 Other account (including uncashed checks and money orders)

payment

Description

Whether the transaction is a payment. A payment is defined as a transaction with a non-missing payment instrument. It may, in some cases, be an asset transfer – for instance, if a person uses a debit card to buy a bond – or it may be an expenditure – buying a cup of coffee with cash. It does not, however, include direct transfers from one owned account to another.

Survey Question

N/A

Details

For non-placeholder transactions, *payment* is set equal to 1 if pi is not missing, or if the transaction was reported in the Purchases or Bills module of the questionnaire. Otherwise it is set to 0.

Coding

0 No

1 Yes

payment	No.	%

purpose

Description

A qualitative description of the payment's purpose, as determined by the various merchant followup questions, as well as the categories in the bill reminder module.

Survey Question

pay010, pay020, pay030, pay040, pay041, pay050, pay082, pay090, pay700, as well as the bill reminder categories

Details

In general, the diary has two kinds of merchant followups: "who did you pay" and "what did you buy". This variable is constructed based on the response to the "what did you buy" followup responses. A complete treatment of the mapping between the various questions and their ultimate codings cannot be given here. However, careful study of the questionnaire and the values of this variable should make it clear how the responses were categorized.

Coding

submerch

Description

A more specific set of merchant categories, where possible. The variable *submerch* is based on four followup questions which are reached when the respondent chooses merchants "Medical care provider", "Retail store or online retailer", or "Other merchant". Note that "Other merchant" does not appear is the final version of the dataset, as all of the transactions were recategorized based on the followups.

Survey Question

pay030, pay600, pay602, pay090

Details

In general, the diary has two kinds of merchant followups: "who did you pay" and "what did you buy". This variable is constructed based on the response to the "who did you pay" followup responses. pay030 responses 1 through 4 are given their own categories, as are all pay600 responses excluding 4 (which is given a *subpurpose* code). Other than that, it is based entirely on responses to pay090.

subpurpose

Description

A more specific set of purpose categories, where possible. Missing values of *subpurpose* should be interpreted to mean that no more specific categorization of this transaction's purpose is possible. They should *not* be interpreted to mean that the transaction does not belong in any of the other categories. For example it is entirely possible that a transaction with *purpose* code 1 and a missing *subpurpose* category is a mortgage payment, even though mortgage is one of the possible *subpurpose* categories.

Survey Question

pay010, pay020, pay030, pay040, pay041, pay050, pay082, pay090, pay700, as well as the bill reminder categories

Details

In general, the diary has two kinds of merchant followups: "who did you pay" and "what did you buy". This variable is constructed based on the response to the "what did you buy" followup responses. A complete treatment of the mapping between the various questions and their ultimate codings cannot be given here. time

Description

The time of the transaction.

Survey Question

Clock widget in the various modules.

to account

Description

The account to which the funds for this transaction were transfered.

Survey Question

N/A

Details

from_account and to_account are purely constructed variables which tracks the movement of money between accounts, as well as tracking which accounts expenditures came from and which accounts income went to. They should generally be used in conjunction with type to truly understand the movement of money.

Coding

- 1 Currency
- 2 Primary checking
- 3 Other DDA account
- 4 Nonfiancial deposit account (e.g. paypal, prepaid card)
- 5 Investment account
- 6 Credit account
- 7 Other long-term assets
- 8 Other account (including uncashed checks and money orders)

2	1,619	25
Total	6,486	100

type

Description

The type of transaction – expenditure, transfer, or income. Also identify placeholder observations.

Survey Question

In some cases, based purely on the module in which the transaction is reported. In other cases, based on the response to followup questions.

Details

Expenditures are defined as money or liquidity moving out of a respondent's possession. Transfers are defined as money or liquidity moving from one account/form to another – for instance, a cash withdawal. Income is defined as money coming into the respondents possession. Expenditures typically come from the purchases or bills modules, income from the income module, and transfers from the rest of the modules, though there are some exceptions.

Placeholder observations are added for every respondent-day, and exist to allow for easier filtering of variables without having to worry about accidentally removing respondents from the dataset.

- 3 Speed of recipient receiving payment
- 4 Speed of notification of new balance of your account

date

Description

The date of the diary day. Each diarist participated in the diary for four consecutive days, with efforts made to ensure a representative sample of Americans on any given day. The dates range from October 13, 2015 to 17 December, 2015. Some diarists participated in the diary twice. In order to ensure the representativeness of the sample and to eliminate any biases from diary fatigue, it is recommended that only dates between October 16 and December 15 be considered.

Survey Question

N/A

Details

In most cases, this variable is determined by the date on which the transaction was reported. For some bills, the date is reported by the respondent on diary day 3 and reassigned ex-post.

carry_acnt2acnt

Description

daily_weight

Description

Whether respondent carried travelers checks on that diary day.

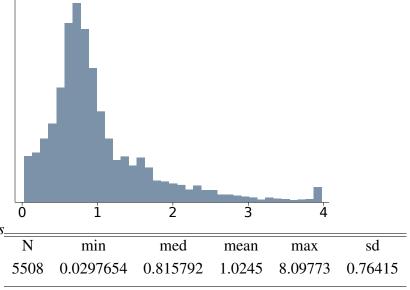

Survey Question

N/A

Details

Raked post-stratification weights. Daily weights are best used for producing single-day estimates. Unlike individual weights, daily weights are not trimmed. These particular daily weights correspond to $rps_w_day_a_uasgfk$ in the $full_weights_dataset$. See Angrisani, M, 2015 Survey and Diary of Consumer Payment Choice Weighting Procedure (2016) for more information about the construction of the weights.

denom_100_end

Description

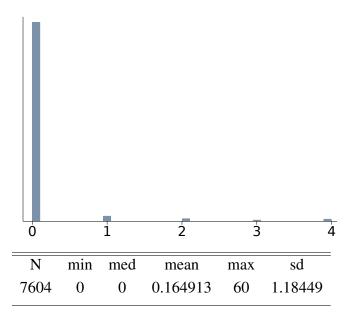

The number of 100 dollar bills carried at the end of the diary day.

Survey Question

From the "Count your Paper Cash" screen at the end of each diary day.

Details

Some amounts are cleaned when it is clear that the individual accidentally reported the dollar value rather than the count of bills.

denom_10_end

Description

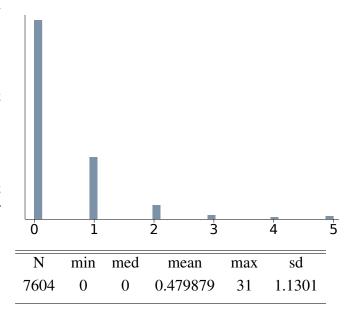

The number of 10 dollar bills carried at the end of the diary day.

Survey Question

From the "Count your Paper Cash" screen at the end of each diary day.

Details

Some amounts are cleaned when it is clear that the individual accidentally reported the dollar value rather than the count of bills.

denom_1_end

Description

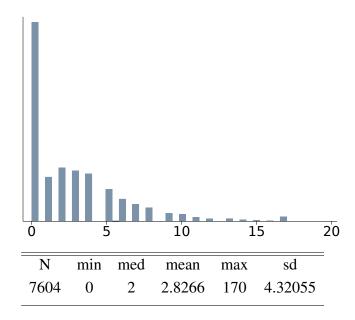

The number of 1 dollar bills carried at the end of the diary day.

Survey Question

From the "Count your Paper Cash" screen at the end of each diary day.

Details

Some amounts are cleaned when it is clear that the individual accidentally reported the dollar value rather than the count of bills.

denom_20_end

Description

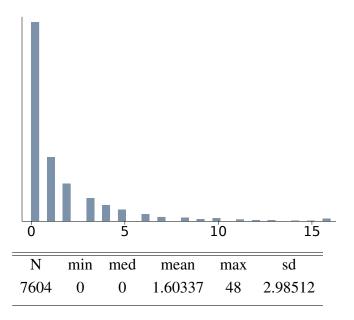

The number of 20 dollar bills carried at the end of the diary day.

Survey Question

From the "Count your Paper Cash" screen at the end of each diary day.

Details

Some amounts are cleaned when it is clear that the individual accidentally reported the dollar value rather than the count of bills.

denom_2_end

Description

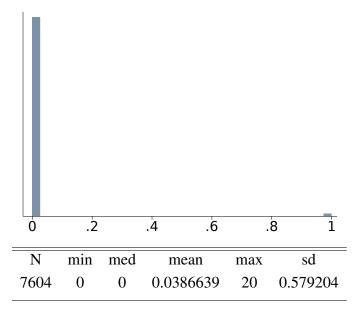

The number of 2 dollar bills carried at the end of the diary day.

Survey Question

From the "Count your Paper Cash" screen at the end of each diary day.

Details

Some amounts are cleaned when it is clear that the individual accidentally reported the dollar value rather than the count of bills.

denom_50_end

Description

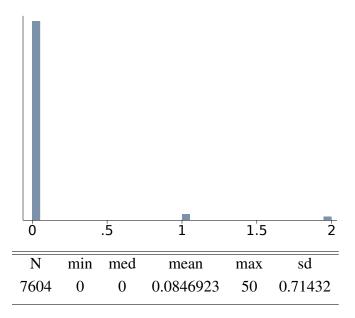

The number of 50 dollar bills carried at the end of the diary day.

Survey Question

From the "Count your Paper Cash" screen at the end of each diary day.

Details

Some amounts are cleaned when it is clear that the individual accidentally reported the dollar value rather than the count of bills.

denom_5_end

Description

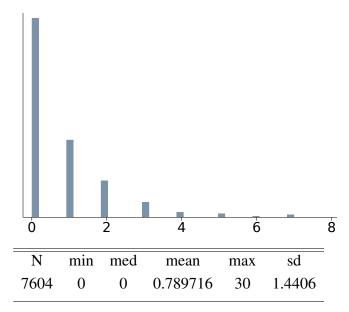

The number of 5 dollar bills carried at the end of the diary day.

Survey Question

From the "Count your Paper Cash" screen at the end of each diary day.

Details

Some amounts are cleaned when it is clear that the individual accidentally reported the dollar value rather than the count of bills.

diary_day

Description

Diary days are numbered between 0 and 3. Note that certain account balances and income payments are reported on diary day 0, but no transactions.

Survey Question

N/A

end_cash_bal

Description

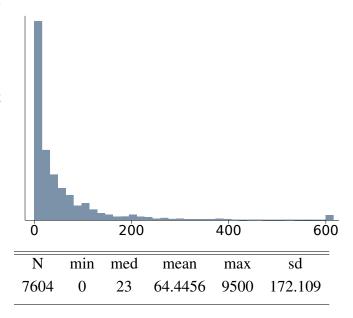

The end-of-day balance of the cash carried by the respondent.

Survey Question

From the "Count your Paper Cash" screen at the end of each diary day.

Details

Implied by the number of each bill that the respondent reports carrying.

nopayments

Description

Why the respondent made no payments on a given day.

Survey Question

q98a

Coding

- 1 I didn't need to make payments today
- 2 I was too busy to make payments today

highest_education_gfk

Description

Respondent's highest level of education, if the respondent is from the GfK sample.

Survey Question

N/A

Details

The GfK panel's question regarding education level is different from UAS's. While the categories can be easily made to overlap, we have left such decisions in the hands of the researcher.
